

# Neopigg®

Complete care for best growth performance of piglets from birth to 18kg

## Neopigg® RescueCare

Neopigg® RescueCare is a complete liquid feeding concept for piglets. It combines easy-to-use liquid products; **Neopigg® RescueMilk** and **Smooth**, with a 24/7 feeding system, which is adaptable to your individual farm setting. Maximising intake pre-weaning to support the development of the digestive system and ensuring a smooth transition at weaning helps producers to capture the full growth potential of their piglets. Over 10 million piglets are fed with the Neopigg® RescueCare system every year. 12,000 sows are on the system in the UK alone.

## Neopigg® Go! & Neopigg® Max 100

Our dry pre-starter diets, Neopigg® Go! and Neopigg® Max 100 are designed to be fed both alongside RescueCare and as stand-alone pre weaning diets from 4 days of age. Carefully selected raw materials and our unique flavourings ensure good intakes whilst piglets are on the sow, which in turn helps drive performance and efficiency post-weaning. Neopigg® Max 100 drives maximum growth and performance and Neopigg® Go! helps smooth the weaning process and minimises any post-weaning dips in performance.

## Neopigg® Max Start, Gain & Advance

The Neopigg® Max programme incorporates a range of dry diets developed to meet the needs of modern UK piglets. Formulated for piglets from 6kg to 18kg. Products can be selected from the range that will drive maximum performance on your unit. Incorporating the latest technologies and ingredient knowledge, Neopigg® Max is unrivalled in maximising the development and growth performance of your piglets.

## Neopigg® Max feeding schedule

Provimi® is brand of Cargill; a family-owned company with more than 150 years' experience in developing food and feed ingredients. Cargill develops results-oriented nutritional solutions and feeding programmes, which in turn help producers grow their business.

**Driving the performance of a lifetime**  
 Advancing starter nutrition for piglets

# Advancing starter nutrition for piglets

Neopigg® Max is a new programme from Cargill, developed with both you and your young piglets' needs in mind.

## Why choose Neopigg® Max?

A family-owned company with more than 150 years' experience in developing food and feed ingredients, Cargill is a world leader in young animal nutrition and continues to build on the foundations of the SCA and Provimi® heritage. By bringing new technologies and knowledge to the market through a range of scientifically proven high performing diets, Neopigg® provides optimal nutrition that meets the needs of modern production systems.

Driving performance during the first weeks of life is critical to the

lifetime success of the pig and delivering maximum return on investment from feed. Cargill's global expertise in ingredients, nutrition and feed management is unparalleled in achieving performance targets. The Neopigg® Max range has been developed by our UK team using the latest Cargill European and global knowledge and technologies. The programme has been trialled in UK commercial conditions to ensure it delivers improved performance where it's needed, giving you confidence and peace of mind.

## Incorporating unique ingredients and the latest technologies

Neopigg® Max diets contain specific Cargill raw materials and additives, but not only that, at Cargill, we also have a detailed understanding of the availability of nutrients to the piglet. Using this knowledge, each ingredient with its proven efficacy, is included at the optimum level to maximise performance in the young piglet at optimal cost.

All Neopigg® Max diets incorporate the following components and each one is tailored for the specific growth stage of the piglets; ensuring a smooth transition from one diet to the next and maximising piglet performance:

## The Neopigg® Max program

We understand every farm situation is different, so we have developed a flexible range of starter diets that can be tailored to your individual piglets needs and business goals. Your chosen Neopigg® Max diets combine into a easy-to-follow program feeding your piglets from 4 days of age through to 18kg. The programme begins with a pre-starter diet to encourage feed intake and prepare piglets for the weaning process, followed by first and second stage diets that drive growth after weaning. Your chosen diets will work in harmony with each other to help ensure a smooth transition for your piglets from one stage to the next.

### Neopigg® Max START First stage diets

#### Supporting gastrointestinal integrity

Pre-weaning dry matter intake accounts for a staggering 44% of post-weaning performance. To support this, Neopigg® pre-starter diets are formulated to be highly palatable which encourages early start-up of feed intake and promotes dry matter intake in the farrowing room.

The raw materials used are specially selected and blended to prepare the piglet's digestive system from digesting the fats and milk proteins in sow's milk to the proteins and starches in cereals and vegetable protein around the point of weaning.

### Neopigg® Max START Pre-starter diets

#### Empowering piglet growth

Gastro-intestinal integrity is supported over the weaning period through the incorporation of Cargill's digestive security pack and a unique flavouring that encourages feed intake. In addition, application of our knowledge of the digestion of the ingredients we use ensures that the Neopigg® Max diets provide the optimum supply of nutrients to meet the piglet's requirements during this critical period.

The inclusion of an advanced vitamin and trace element package specifically tailored for rapidly growing piglets provides additional support and also maintains antioxidant status in the animal.

**The result** Piglets achieve maximum growth. Results from UK trials show that when compared to standard diets, piglets grew up to 21% more driving up to a 12% reduction in cost/kg gain over the period they were fed a Neopigg® Max start diet.

### Neopigg® GAIN & ADVANCE Second and third stage diets

#### Laying the foundations for a lifetime of performance

Starter feed equates to only 3% of the total food eaten in the lifecycle of the commercial pig, but yet determines 30% of the variation in growth until slaughter. To help piglets reach their potential, Neopigg® Max Gain and Advance diets deliver maximum growth in the critical post-weaning phase.

By supplying the right nutrients in the right quantities at the right time, piglets are supplied only with what they can use - driving return on investment by achieving maximum daily

liveweight gain (DLWG) per unit of feed eaten.

**The result** Results from UK trials show, on average, up to an 8% improvement in feed conversion in the overall post weaning phase when piglets were offered Neopigg® Max diets. This is crucial, as a good conversion in the post weaning phase leads to a good conversion in the finisher stage; Neopigg® Max therefore works with businesses to promote lifetime efficiency.
